

Problem Statement: AI-Powered Personal Investment Advisor with Background Analysis & Risk-Based Planning

The Problem: Most people want to invest but don't know where to start their decision depends on their financial background, prior investing experience, and risk comfort, but no single tool considers all of this together. Beginners get the same generic advice as experienced investors, and people who've faced past losses don't understand why it happened or how to move forward smartly.

What to Build: Build an AI-powered system (a single integrated AI-driven tool) that gives personalized investment guidance based on the user's full profile:

Step 1: User Profile Input

- Investment budget (how much they want to invest now)
- Prior investing experience (Beginner / Intermediate / Experienced)
- Background details have they invested before, in what (stocks/gold/crypto/mutual funds), for how long
- Past loss details (optional) how much lost, in what, and why they think it happened

Step 2: AI Background & Loss Analysis

- If past loss is mentioned, AI analyzes it using real market data (e.g., "you bought at market peak" or "panic sold during a dip") and explains the reason clearly
- AI factors in the user's experience level to judge how much guidance/hand-holding they need

Step 3: Risk Assessment

- Ask if the user is willing to take high risk for higher returns (Yes/No)

Step 4: Personalized Recommendation

- **If High Risk (Yes):** Suggest aggressive investment options (high-growth stocks, volatile assets) using real market data, adjusted for their experience level, with clear reasoning for each pick
- **If Low Risk (No):** Suggest a safe SIP/mutual fund style plan, calculate expected returns over time, and set a monthly investment reminder with the historically best time to invest

Step 5: Ongoing Optimizer

- Track the user's plan and suggest adjustments (e.g., "this month is better to invest more based on current dip")

Expected Flow:

Enter Profile (Budget + Experience + Background) → Enter Past Loss Details (if any) → AI Explains Loss Reason → Ask Risk Preference → Show High-Risk Plan OR Low-Risk SIP Plan (adjusted for experience) → Ongoing Optimizer Suggestions

Data Source: Real stock/gold/crypto market data via yfinance (live + historical prices), user-provided profile inputs (budget, experience, background, loss details, risk choice)

Deliverable:

A working web-based tool where a user enters their financial background and experience, budget, and past loss history (if any), gets an AI-explained analysis, answers a risk-preference question, and receives a personalized investment plan tailored to their experience level backed by real market data.
